Immediate vicryl mesh insertion after lumpectomy, Advantages and efficiency: Review

Muteb Sulaiman Saif Alshammari
University of Hail, Saudi Arabia

We aimed by this review to overview the benefits and disadvantage of vicryl mesh insertion immediately after lumpectomy. We conducted a search using electronic databases; MEDLINE, and EMBASE, through October 2017. Search strategies used following MeSH terms in searching: “mastectomy”, “breast cancer”, “lumpectomy”, “vicryl mesh”, “absorbable mesh insertion”. Immediate Vicryl mesh insertion is a simple approach. It leads to considerably boosted occurrence of postoperative difficulties and delay in commencement of adjuvant radiotherapy. The aesthetic end results are not remarkable to that of no reconstruction. Some proof showed that the Vicryl mesh is an effective option to acellular dermal matrix in nonirradiated bust restoration and is offered at lower cost in contrast with different ones.
