

# 26<sup>TH</sup> WORLD CANCER AND ONCODIAGNOSTICS CONFERENCE

November 27-28, 2017 Dubai, UAE

## *Hosam Al-Qudah*

Al Zahra Hospital Dubai, UAE

### **Minimal invasive management of small kidney tumors**

Kidney tumors are being diagnosed in higher rates these days. Incidental finding of small renal masses is the commonest presentation. Minimal invasive management of these small masses is the slandered of care now. In this presentation, author will present an updated approach on management of these masses. The objectives are to discuss the difference between all available minimal invasive management of these small tumors, this will include laparoscopic partial nephrectomy and robotic partial nephrectomy; advantages of both modalities over open surgery and difference between them. We will discuss the difference between tumor enucleation versus resection and the advantage each has. Tumor ablation with different modalities is the last part of the presentation including cryosurgery, radiofrequency and other available options. Minimal invasive management of small kidney tumors is the slandered of care all around the word. These are safe and reliable methods of tumor management.

### **Biography**

Hosam Al-Qudah is an Uro-Oncologist and a Transplant Surgeon with special training in Laparoscopic Urology. He is currently working in Al Zahra Hospital Dubai (a tertiary referral private center) with a good number of different types of uro-oncology and laparoscopic cases.
