## Synthesis and enzyme inhibition study of dihydrofurocoumarin and dihydrofuropyrane compounds

Asli Ustalar and Mehmet Yilmaz  
Kocaeli University, Turkey

Coumarin derivatives such as *Scopoletin*, *Esculatin*, *Fercoprolone*, *Hohneliacoumarin*, *Angelicin*, *Psoralen* and *Aureptene* have been found in nature and they possess many biological activities varying from anticancer, antioxidant, antibacterial, antifungal and anticouglant. It is well known that  $Mn(OAc)_3$  have been used as radical oxidant in the synthesis of dihydrofuran derivatives forming C-C bond between active methylene compounds and alkenes. In here, we performed the reaction of 4-hydroxycoumarin and 4-hydroxypyran with conjugated amide and esters promoted by  $Mn(OAc)_3$  leading to dihydrofurocoumarins and dihydrofuropyranes in moderate to good yields. All new compounds were characterized by spectroscopic techniques. Also, we investigated enzyme (cGMP PDE- cyclic guanosine mono phosphate phosphodiesterase) inhibitions of these compounds.

### Biography

Asli Ustalar has completed his MS from Kocaeli University. She is a PhD student in Kocaeli University.
