August 27-28, 2018 | Zurich, Switzerland

Paulo Antonio Rodrigues Gouveia

Institute Tocantinense, Brazil

Therapeutic use of *Guazulma ulmifolia* lam extract of Northern Brazil

This study aims to analyze the therapeutic use of *Guazulma ulmifolia* lam extract as an AIDS treatment, describing the management of treatment performed in a clinical report. This work was a literature review. The case reported was a 35-year-old Mozambican, diagnosed with HIV virus in 2008. In March of 2017, she started using *Guazulma ulmifolia* lam extract for 30 days, and has since received successive negative HIV test results. It was concluded that the efficacy of *Guazulma ulmifolia* has been increasingly proven for the treatment of AIDS, with the advantages being a natural remedy, without any side effects, and there is no ethical-moral impediment to be applied in infected population.

Biography
