## Treatment by I131 therapy in hemodialysis: About a case

**Baya Gued, Dahoun, M Chiad, Y Boulahia and D Iftene**

Central Hospital of Army, Algeria

The incidence of the thyroid cancer to chronic kidney disease (CKD) was estimated to be 02% twice as frequent in the women; the coverage does not differ from that of the patient with normal renal function. The prescription of an I131 therapy as therapeutic complement is possible in theory, and despite a low risk of external radiation; we dispose of very few data and no recommendation exists for this category of patients. We report the case of a 29-year-old female patient with end stage renal disease (ESRD) dialyzed 3 times in week, in whom a thyroid papillary carcinoma was discovered during an assessment for transplantation or a treatment by I131 therapy was indicated then of two cures.

### Biography

B Gued is a Medical Doctor graduated from the University of Algiers in November, 2005. She worked on emergencies from August, 2006 till October, 2007. She began her Specialty in November, 2007 and is Specialist in Nephrology from the University of Algiers (April, 2013).
