## Bronchiolitis: Different practices, but does it really work?

**Khalid Al Ansari**

Hamad Medical Corporation, Qatar

**B**ronchiolitis is the most common serious lower respiratory tract illness in young infants affecting mainly children between 2 and 5 months of age. It is also a common cause for admission to inpatient especially in infants less than 6 months of age. After decades of research, the recommended treatment remains supportive care. Different practices and many pharmaceutical have been studied with different outcomes. In this presentation, I will talk about the significance of this disease, health impact, and will discuss different tested modalities of treatment and the evidence to support or discourage their use.
