## INNOVATIONS WITH VAC IN COMPLEX PERIANAL WOUNDS WITH DIVERSION STOMA

Abhishek Tiwari<sup>a</sup> and Arun Prasad<sup>a</sup>

<sup>a</sup>Apollo Hospital, India

Complex perianal injuries are devastating for patients suffering from them either due to Retropharyngeal Abscess (RTA) or Abscess. Long duration of hospital stay huge cost of management long term antibiotics and analgesics, patient and attendant loss of working days. In short high morbidity and mortality rate in these injuries by conservative management calls for innovation to improve factors discussed above. We managed 6 cases with perianal injuries by diversion stoma and vac dressing along with innovations with advance dressing which otherwise would have taken months to heal or may have scumbed to injuries. Updates and advancement are important aspects of the surgical field and still wound care treated as an orphan son with lesser attention, but it is a morbidity for patient suffering more than any other surgical condition or emergency. Innovations in wound care are need of time and require advancement for better patient care for example in this case perianal injuries.

### Biography

Abhishek Tiwari has been Graduated from SS Medical College of Rewa, India as Medical Doctor, with the specialties Internal Medicine, PSM, Orthopaedics and ENT. Later on he obtained his post-graduation from KMC Mangalore with subject Gen Surgery including Minimal Access/Robotic Surgery and special interest in wound care and then started working at The Indraprastha Apollo Hospital , New Delhi, where he has continued his research. Presently he is working at the at the New Delhi City.
