Health personnels' attitudes to HPV

Feride Yigit and Gulen Kaptan
Istanbul Arel University, Turkey

HPV is the most common viral infection in the reproductive system. Most of the men and women who have been sexually active, in particular polygamy is in question that after a certain time the disease will occur, some becoming infected more than once. It is a sexually transmitted infection and does not need full vaginal intercourse, even genital contact is sufficient to be infected. The aim of this study is to identify type research; information on HPV and the attitudes of health workers. Research was done as a tool for data collection; personal information form, Hendrick Sexual attitude Scale and HPV information form including 3 questionnaires will be used. The data in the computer environment will be evaluated using the appropriate statistical analysis. The realization of the work permit is taken from the ethics committee of Istanbul Arel University.
