HEAD AND NECK CONFERENCE: THE Multidisciplinary Approach

December 10-11, 2018 Dubai, UAE

Functional endoscopic sinus surgery in sinonasal polyposis

Mohsen Naraghi Tehran University, Iran

S inonasal polyposis is an inflammatory condition of the nose and paranasal sinuses, sometimes associated with chronic rhinitis, aspirin intolerance and asthma. Recent improvements in endonasal surgery such as functional endoscopic sinus surgery, caused more complete removal of polyps and better control of associated rhino sinusitis. However nasal polyposis in the triad patients remains a challenge. Endoscopic surgery alone could not treat the underlying inflammation of the nasal mucosa. Postoperative medical management with follow up endoscpic control is mandatory to prevent recurrence. In this presentation, preoperative, operative and postoperative aspects in the management of sinonasal polyps by endonasal endoscopic surgery will be discussed.

Biography

Mohsen Naraghi is a double-board certified facial plastic reconstructive surgeon with more than two decades of academic postgraduate teaching experience in rhinology and facial plastic surgery. He was ranked first among all the national graduates of medicine, was awarded the first rank in the national comprehensive medical examinations, graded first in the national board examinations in otolaryngology-head and neck surgery, and also became the fellow of the European board of otorhinolaryngology-head and neck surgery. He continued his training in facial plastic surgery and rhinology fellowship, receiving the international board for certification in facial plastic and reconstructive surgery.
