Scarless wound repair: The must-know cellular and molecular, medical and surgical points

M R Namazi

Shiraz University of Medical Sciences, Iran

The healing of wounds with minimal scarring has always been the concern of patients and their physicians. Humans are erroneously inclined to make a negative correlation between the healing rate and the degree of scar formation, while such a correlation does not exist in reality. In this presentation, I will present a brief discussion of molecular and cellular events underlying scar formation as well as the must-know medical and procedural approaches to minimize scar formation plus my own experience. The presentation also includes some videos of proper surgical approaches to mitigate scar formation.
