

International Conference on

Quantum Mechanics and Applications

July 20-21, 2018 | Atlanta, USA

Based on quantum entanglement technology construct universe network with everything connected

Xiang Yibin

Hunan International Economics University, China

In recent years, greater breakthroughs have been made in the study of complex networks. Quantum computers, quantum communication, and quantum Internet are gradually becoming the focus of research. Quantum communications using quantum entanglement effect for information transfer are highly valued by all walks of life. Through the analysis of the interaction of various microscopic particles in the universe, the article put forward the following viewpoints: The universe is a physical entity constructed by various substances, consciousness exists naturally at the quantum level and the microcosmic field. All things have an interconnected of non-locality in time and space, and everything in the universe is based on interrelating of quantum entanglement. At the same time, by analyzing the cellular and nervous system functions of organism body, and the influence of quantum science theories on consciousness point out that: The phenomenon of biological electricity is closely related to consciousness. Between quantum mechanics and consciousness, it is not the relationship between one party that completely belongs to the other party, but it is interaction and mutual influence relations between the fluctuations of entangled quantum production and the fluctuations generated by bioelectricity. The combination of quantum entanglement technology and thinking consciousness can realize the interconnection between human beings and universe. In this paper, by discussing the interaction between various fields in the quantum field theory, the relationship between the Schwarzschild radius and the Compton wavelength, and the impact of quantum entanglement effect on everything in the universe, focusing elaborates on the sensing relationship between quantum entanglements with the life body and the non-living body, the influence of quantum vibrations on the quantum vibrations of the life body or the non-life body which have the entangled relationship with it, As well as the correlation between thinking consciousness and quantum entanglement. The feasibility of constructing the cosmic network by infiltration the entangled quantum into the human and objects is expounded. As well as the techniques and methods that relate the entangled quantum to the related life body and the inanimate body. Final analysis of the construction of such a complex network of existing technical problems and safety issues, and designed a plan for the relevant ideological experiments, will do further research.

Biography

Xiang Yibin has long been engaged in computer teaching and management. Once served as director of network and information department in the School of Information Science and Engineering of Hunan International Economics University. Now mainly engaged in network-related teaching and research work. The main research direction: network technology and security management. In 1988, participated the work that in the translation of the monitoring program "KENTAC 800ZC" and the part program design of "automatic control of the test bed with single-chip microcomputer". In 2001, involved in the construction of the campus network project. Have published more than 10 articles in reputed journals, and have won a number of patents. Now mainly engaged in Smart equipment manufacturing and intelligent network marketing system construction and security management-related research. At the same time engaged in based on the quantum entanglement effect of complex network construction-related research.
