Physiotherapy & Physical Rehabilitation

March 25-26, 2019 | Rome, Italy

Functional neurology cases

Khin Maung Bo

Rehab Medicine Service, Barnard Court Health Centre, UK

Functional neurology disorder (FNDs) cases are not uncommon in neurorehabilitation practice. It is very challenging to rehabilitation professionals. Main presentations can be mobility problems, pain, weakness, speech disorder, coordination, psychological, seizure, dystonia etc. etc. Most of the time, they underwent extensive and repeated investigations leading nowhere. This is draining resources on health and social services. There will be three to four or more functional neurology cases with a variety of presentations. There are no smoking guns in diagnosing FNDs. The professionals need to pick up inconsistencies in the presentations with investigation findings.

Biography

Khin Maung Bo is involved in Neurorehabilitation for over 20 years. He is also a Lecturer in Hull and York Medical School teaching 4th Year Medical Students in CNS and Musculoskeletal Blocks. He is doing botulinum toxin injection in spasticity, dystonia and involuntary movement disorders over 15 years and done Poster presentations and Oral Presentations in International NeuroRehabilitation Conferences.
