

11th World Congress and Expo on **Recycling**

June 13-14, 2019 | Edinburgh, Scotland

Sea cleaning under Bio-remediation (technologies sharing for all kind of plastic recycling reused) & sewage treatment

Raagini Jaain

Geetanjali Envirotech, India

Untreated wastewater and leachate pose serious environmental threats and have serious implications for human health. This has led to the enforcement of stringent guidelines for manufacturing industries, municipal sewage facilities and residential developments alike, to treat waste water before discharging it to public sewerage lines or natural water bodies. The key issues are ocean bioremediation, reduction of sludge, elimination of odours and improvement of the overall quality of the discharged water, as per the guidelines.

Biography
