Introduction

Health policy are often defined because the "decisions, plans, and actions that are undertaken to realize specific healthcare goals within a society". Consistent with the planet Health Organization, a particular health policy are able to do several things: it defines a vision for the future; it outlines priorities and therefore the expected roles of various groups; and it builds consensus and informs people. There are many categories of health policies, including global health policy, public health policy, psychological state policy, health care services policy, policy, personal healthcare policy, pharmaceutical policy, and policies associated with public health like vaccination policy, tobacco control policy or breastfeeding promotion policy. They'll cover topics of financing and delivery of healthcare, access to worry, quality of care, and health equity. Health-related policy and its implementation is complex. Conceptual models can help show the due health-related policy development to health-related policy and program implementation and to health systems and health outcomes. Policy should be understood as quite a national law or health policy that supports a program or intervention. Operational policies are the principles, regulations, guidelines, and administrative norms that governments use to translate national laws and policies into programs and services.

The policy process encompasses decisions made at a national or decentralized level (including funding decisions) that affect whether and the way services are delivered. Thus, attention must be paid to policies at multiple levels of the health system and over time to make sure sustainable scale-up. A supportive policy environment will facilitate the scale-up of health interventions.

In some jurisdictions and among different faith-based organizations, health policies are influenced by the perceived obligation shaped by religious beliefs to worry for those in less favorable circumstances, including the sick. Other jurisdictions and non-governmental organizations draw on the principles of humanism in defining their health policies, asserting an equivalent perceived

obligation and enshrined right to health. In recent years, the worldwide human rights organization Amnesty International has focused on health as a person's right, addressing inadequate access to HIV drugs and women's sexual and reproductive rights including wide disparities in maternal mortality within and across countries.

There remains considerable controversy regarding policies on that would be paying the prices of medical aid for all people and under what circumstances. For instance, government spending on healthcare is usually used as a worldwide indicator of a government's commitment to the health of its people. On the opposite hand, one school of thought emerging from the us rejects the notion of health care financing through taxpayer funding as incompatible with the (considered no less important) right of the physician's professional judgment, and therefore the related concerns that government involvement in overseeing the health of its citizens could erode the proper to privacy between doctors and patients. The argument furthers that universal insurance denies the proper of individual patients to eliminate their own income as per their own will. Medical research is often both the idea for outlining evidence-based health policy, and therefore the subject of health policy itself, particularly in terms of its sources of funding. Those in favor of state policies for publicly funded medical research posit that removing profit as a motive will increase the speed of medical innovation. The existence of sound medical research doesn't necessarily cause evidence-based policymaking. For instance, in South Africa, whose population sets the record for HIV infections, previous government policy limiting funding and access for AIDS treatments met with strong controversy given its basis on a refusal to simply accept scientific evidence on the means of transmission.
