Keywords: Complementary therapy; Yoga; Headache; Migraine
Abstract

Primary headache and Migraine are common conditions in every society and are the 6\textsuperscript{th} leading cause of disability worldwide, affecting approximately 12\% of Americans and millions worldwide, resulting in an inability to attend work or school for at least 1 day every 3 months. Numerous pharmacological options exist for headaches treatment, but these therapies come at high cost and carry numerous potential adverse effects. Yoga is an ancient Indian non-religious technique that is known to aid in treatments of chronic conditions such as stress, anxiety, depression, hypertension and diabetes, and have a substantial effect on reducing headache burden.

Research studies have been conducted to demonstrate the effectiveness of yoga lifestyle modifications and exercise on chronic pain syndromes, specifically in primary headache and migraine. Yoga was shown to improves quality of life, reduce headache intensity and headache frequency, when used alone or as an adjuvant to conventional therapy and show a significant decrease in headache frequency and intensity along with a reduction in the use of symptomatic medication.

Yoga, being a slow non-exertional aerobic exercise, enhances mood and alleviates stress and depression in adults and invaluable treatment alternative in the pediatric population, where it can create a sustainable healthy lifestyle.

Introduction

Headache is one of the most common symptoms observed by healthcare professionals in their day-to-day clinical practice and the biggest contributor, affecting approximately 12\% of Americans and millions worldwide. [1] It has been shown to be a main reason for decreased work or school productivity by 50\% in almost half of affected individuals during an attack and thus has a significant impact on overall well-being and quality of life [2] and can result in an inability to attend work or school for at least 1 day every 3 months. [3] In the USA alone, migraine contributes to 86.5 million lost workdays each year and to an indirect annual cost of $9.3 billion. [4] Headache can be a secondary symptom of many neurological disorders as well as a primary disease and a risk factor for stroke, hypertension, diabetes, asthma and obesity . [5] It includes migraine headache, tension headache and trigeminal autonomic cephalalgias such as cluster headache and characterized as a recurrent disabling headache, pulsating or throbbing in quality, and moderate to severe in intensity. Migraines are often accompanied by photophobia, phonophobia, nausea, vomiting, and aggravated by routine physical exercise [6] and is classified into two categories: episodic migraine and chronic migraine. Chronic migraine is defined as \( \geq 15 \) headache days per month with \( \geq 8 \) days per month that meet the criteria for migraine and/or when a migraine medication such as a triptan is used for more than three months. [6,7] Episodic migraine is defined as 14 or less headache days per month. [8] Tension headaches are reported as recurrent episodes of headache which are typically pressing or tightening in quality, of mild to moderate intensity, bilateral in location and do not worsen with routine physical activity. [9] Globally, more than three billion people are estimated to be suffering from migraine and tension headache.
estimated to account for 11.2% of YLDs (years lived with disability). [10,11] Prevalence is higher in females than in males with a changing ratio of 2:1 to 3:1, especially between the ages of 25 and 55 years. [12] For migraine, reported global age-standardized prevalence in 2016 was 14.4% (13.8–15.0) overall: 18.9% (18.1–19.7) for women, and 9.8% (9.4–10.2) for men (Table 1). [11] Worldwide, at any given time, it is approximated that 47% of adults have an active headache, 10% have a migraine, 38% have tension-type headache and 3% have a chronic headache. In the USA, headaches are the leading cause of outpatient visits to emergency department. [13]

Table 1: Global prevalence: Types of headaches

The wide prevalence of headaches creates a burden not only on individuals, but also to society as a whole, with significant socioeconomic outcome. Headache management is traditionally based on pharmacological therapies. However, only about half of migraineurs show clinically positive responses to medications. [3] The management of headache includes pharmacologic treatment used as abortive treatment and for prevention. These drugs carry the risk of substantial adverse effects along with issues of compliance and adherence in the long-term. As example, regular use of analgesics for headache relief can have an adverse effect of paradoxically causing a headache. There are two ways in which an individual can increase their risk of developing a headache-related medication overuse: Either by using NSAIDs for at least half a month or by using a combination of analgesics, opioids, ergotamines or triptans for one third of a month or more. [4] Lifestyle adjustment, such as yoga, can decrease the burden on headaches. The National Institute of Health defines complementary and alternative medicine/treatment as a group of diverse medical and health care systems, practices, and products that are not included in conventional medicine. [14] Hence, alternative treatments are commonly used in addition to the conventional treatments, although patients with migraine do not use alternative treatments alone. [15]

Yoga is an ancient Indian non-religious technique, that combines both physical postures and breathing exercises known to decrease chronic pain syndromes by relieving stress. It may be implemented as an adjunctive approach in addition to pharmacologic therapy and other lifestyle modifications. Yoga has been shown to be effective in prevention and treatment multiple chronic conditions such as stress, anxiety, depression, hypertension and diabetes and is known to have a substantial effect on reducing headache burden. [3] Yoga can provide many different physiological benefits. It has the ability to change heart rate, respiratory rate, fasting blood glucose, and blood pressure. [16] For example, yoga can increase vagal tone while reducing sympathetic activity. The potential of yoga to increase vagal activity elucidates some of its health benefits. [17]

In a 2016 national health survey in the USA, it was found that 21 million Americans practiced yoga in the past year. Americans reported practicing yoga for three main reasons: to increase energy, to improve their immune system and to prevent disease. The three major health conditions Americans reported included back pain, arthritis, and stress. [17] Yoga can be implemented as a sustainable therapy for chronic pain syndromes and as an important non-conventional treatment that has been shown to reduce chronic pain, stress, and other risk
factors of headache such as psychiatric conditions and obesity. In yoga theory, migraine is considered as an Adhijavyadhi, a mind-body disorder, where the disturbances in the mind influence the flow of Prana, which is the vital force/breath, resulting in physical problems and affecting the weakest system in the body. [18] Yoga can be practiced as a mind-body intervention on a daily basis, that incorporates various stretching, breathing exercises, and asanas/postures, to create relaxation known as Shavasana. [19] The aim of this review is to provide comprehensive evidence for the practice of yoga as a more beneficial treatment modality for headaches than current pharmacologic treatment.

**Review Article Methods**

Journal articles were reviewed by using a PubMed search of the past 15 years for all studies pertaining to yoga as a treatment for headache. Attention was made to look for articles explaining how yoga can be used as a treatment for different types of headaches such as migraine and chronic tension type headaches, specifically the duration and frequency of yoga that was used and a description of the results, demonstrating the potential effects that yoga could have for patients. The review was analyzed by the number of subjects and implementation of yoga or complementary alternative medicine (which included yoga) as a treatment for headache. Articles that used yoga combined with alternative treatments along with pharmacological medications were not excluded, rather, purposely included to show how yoga could be used in conjunction with other medical treatments. Controlled prospective non-randomized, cross-sectional, and comparative studies were included along with randomized control studies. The reviewed articles were not standardized by the number of patients nor by the populations from which patients were selected, which range from 19 patients to 23,393 patients.

**Yoga as remedy for Headache in evidence-based literature:**

There are several research studies that scientifically support the use of yoga to improve the quality of life of people with headaches. [20] Combined use of Ayurveda and yoga has been shown to significantly reduce migraine and stress. [19] Specifically, for episodic migraine, studies have demonstrated that the application of integrative medicine, including yoga among other therapies, reduces overall stress level as well as headache frequency. [21] A 90-day study by Sharma et al. recruited 30 subjects in an Ayurveda and yoga group compared to 30 control subjects who received NSAID’s to determine if Ayurveda and yoga could decrease symptomatology associated with headaches. The study showed yoga to significantly reduce pain intensity and improve the quality of life in patients with migraine. Specifically, the study was able to show that traditional Ayurveda along with yoga therapy decreased migraine symptoms. [20] Kisan et. al. showed a similar reduction in pain intensity and demonstrated an improvement in vagal tone and reduction of sympathetic activity in such patients. [19] Another study by Wells et al. showed reduction in migraine attacks after 8 weeks of mindfulness-based stress reduction, with decreased medication use in all groups, although the sample size was too small to detect a statistically significant affect. [14] The decreased use of medication led the authors to suggest an alternative medicine can help treat headaches by increasing tolerance to pain. [14] Moreover, it has been shown that meditation, in addition to
conventional care, was able to significantly relieve severity, duration, and frequency of headaches. [22] A study performed in female migraineurs assessed the effect of 12 weeks yoga training of headaches and they found that the frequency, duration and intensity of headaches was significantly decreased. [11]

In an open labeled, non-randomized, ninety-day study by Vasudha et. al., thirty subjects were recruited to an Ayurveda and Yoga group in comparison to thirty subjects in a control group who continued to take non-steroidal anti-inflammatory drugs (NSAID’s). This study assessed perceived stress, heart rate variability, muscle tension, and migraine disability. Using these measures, the study determined a significant reduction in migraine disability and perceived stress, in the Ayurveda and Yoga group and it was able to determined that the Ayurveda and Yoga group had decreased frontalis muscle activity (a proxy for muscle tension) and improved sympathovagal balance compared to the control group. [23] Patients with chronic tension type headaches suffers from temporalis muscle over activity. In a study by Bhatia et al. individuals who used yoga had decreased amplitude measured by an EMG of the temporalis muscle which indicates the potential of yoga as a treatment modality for chronic tension type headaches. [24] In a review by Wahbeh et al. it was concluded that there is significant advantage in using mind-body techniques as a treatment modality for migraine headaches. [25] Furthermore, they noted that chronic tension and mixed type headaches could also benefit from mind-body techniques.

Treatment approaches for stress related headache are invariably focused on improving lifestyle with recommendations including avoidance of triggers, healthy diet, sleep, and exercise, such as yoga. [26] A study carried out on a pediatric population by Dalla Libera et al., used alternative therapies, including yoga, as a preventive treatment for migraines, and was able to avoid the use of pharmacological medications. [27] Another study that evaluated the effect of yoga over 8 weeks as a treatment for chronic headaches, showed favorable results, in terms of improved daily functioning and quality of life. [28] In the systematic review by Rastogi et. al. it was determined that children often require changes in lifestyle or other alternative treatments in order to have significant improvement in their headaches and suggested a migraines-lifestyle management approach, acronym SEEDS: Sleep properly, Exercise regularly, Eat healthy, Drink water, and Stress management. [29] Therefore, yoga could become an invaluable treatment alternative in the pediatric population as it can create a sustainable lifestyle, showing the need for conducting further studies on yoga and headaches as a potential treatment modality in the pediatric population. In a review where six randomized controlled trials were analyzed investigating the effect of yoga on headaches, yoga exercise resulted in a significant reduction in headache intensity, frequency and in anxiety and depression. [3] In particular, one randomized controlled trial compared the effect of yoga as a treatment for headaches, showing that there was a significant decrease in headache frequency and intensity along with a reduction in symptomatic medication used. This trial implemented yoga poses and breathing techniques to manage headaches and even though both groups received medication, the yoga group had significantly reduced frequency and intensity of their headaches. [3] A metanalysis by Anheyer et al. analyzed the effects of yoga on headaches where they found preliminary evidence supporting the effectiveness of
yoga to improve features of headaches like duration, intensity and frequency in a short period of time. [20] However, a systematic review by Skelly et al. showed less enthusiastic results but nonetheless positive, with only mild to moderate improvement for chronic pain conditions in different parts of the body after using alternative therapies like yoga and massage. In a study by Göksel et al.,110 primary headache patients completed a questionnaire regarding their use of complementary and alternative medicine to treat their headaches. This study has shown that massage was a beneficial alternative treatment in one-third of patients with primary headaches and that other alternative treatments like yoga had additional important role in relief treatment. [30] It was likewise shown that in people with primary headaches who tried alternative treatment, yoga has an important role in relief treatment. A metanalysis by Bussing et. al. has found that even short-term implementation of yoga was beneficial in treating patients with headache/migraine. [31]

There is increasing scientific evidence showing that decreased physical activity is associated with increased prevalence of migraine and non-migraine headache, and aerobic exercise can be used as alternative therapy to improve headache. [32,33] Other studies reported that yoga, being a slow non-exertional aerobic exercise, is more beneficial than pure aerobic exercise since it enhances mood and alleviates stress and depression. [22] Furthermore, in a systematic review by Amin et. al. it was proposed that exercise for migraine prophylaxis may be related to increased beta-endorphins, endocannabinoids and other neurotrophic factors. [34] In conclusion, yoga may be the happy medium between the two for migraine headache prophylaxis.

Table 2: Review of Clinical Studies on Yoga and Headache

Limitations:

The review of the literature indicates that current studies often contain a small sample size. Larger sample sizes would be helpful in order to further study the potential of yoga as a treatment modality for headaches. Additionally, as of this writing, there is no standardized way of implementing yoga as a treatment modality for headache or pain in general. There are numerous kinds of yoga practice and the effects of each should be further studied to understand which yoga practices are most effective at reducing headache burden in individuals. Yoga is most commonly practiced by young, Caucasian, college-educated women who are already in good health. [17] This poses another limitation on the current studies and provides reason for further studies to be performed. A broader demographic sample size, along with evidence showing its efficacy across more races and ethnicities would provide stronger evidence as to its benefit.

Conclusion:

There is growing evidence that supports the benefits of yoga in improving physical and psychosocial health. Multiple studies and meta-analysis have been conducted to show the positive effect of yoga on various chronic pain syndromes and headache. Yoga was shown to improves quality of life, reduce headache intensity and headache frequency, when used alone
or as an adjuvant to conventional therapy and show a significant decrease in headache frequency and intensity along with a reduction in the use of symptomatic medication.

Yoga, being a slow non-exertional aerobic exercise, was reported to be more beneficial than pure aerobic exercise as it enhances mood and alleviates stress and depression. For children, who often require migraines-lifestyle management approach, yoga becomes an invaluable treatment alternative in the pediatric population as it can create a sustainable sleeping, exercising, and nutrition lifestyle.

This review illustrates that by implementing yoga as a treatment modality for headaches, is a sustainable option that has little to no adverse effects, simple to implement and comes at a minimal cost to patients and society.

**Terminology:**

Ayurveda: A holistic healing system, developed more than 3,000 years ago in India and based on the belief that health and wellness depend on a delicate balance between the mind, body, and spirit. Ayurveda places great emphasis on prevention and encourages the maintenance of health through close attention to balance in one’s life, right thinking, diet, lifestyle and the use of herbs.
