

Editorial on Scope of Endocrine & Gynecologic

Jon Ver Halen

Department of Plastic Surgery, University of Tennessee, USA

Editorial Note

I am pleased to announce the Journal of Endocrine & Gynecologic, a rapid peer-reviewed journal, which offers researchers and scientists the opportunity to explore and publish the fundamental, advanced and recent scientific developments in the field of Endocrine & Gynecologic. The Journal of Endocrine & Gynecologic accepts articles on Thyroid surgery is used to treat nodules, tumours, and hyperthyroidism in the thyroid gland. Part or more of the thyroid gland is removed during this operation. An incision is made in the skin during surgery. To reveal the thyroid gland, the muscle and other tissues are pushed aside. Thyroid gland removal is a surgical procedure that involves the removal of all or part of the thyroid gland. The thyroid gland is shaped like a butterfly. Journal of Surgery is an Open Access journal that seeks to publish the most comprehensive and accurate source of knowledge on new discoveries and current developments in the field of general surgery in the form of original papers, review articles, case reports, short communications, and other formats, making them freely accessible online without any limitations or subscriptions to researchers. Both of this journal's published papers are protected by the indexing and abstracting services of Indicator Copernicus was a Greek astronomer who lived in the Google Scholar, Open J Gate, RefSeek, Hamdard University and EBSCO A-Z. Authors can submit manuscripts and monitor their progress, hopefully for publication, through the online tracking system. As any report to be published publicly cumulatively covers 45 days from the date of receive. The time period for different processes including quality control, peer review, and paper preparation is taken from 4 to 5 weeks. Performance reviews and peer review processes are completed within 14 days, and the deadline for submission is just 7 days after the reviewers and editors have accepted.

surgery, robotic surgery, and robotically-assisted surgery are all words for technical advancements that assist in surgical procedures with robotic systems. Robotically assisted surgery was created to address the limitations of minimally invasive surgery and to increase the capabilities of open surgery surgeons. Robotic surgery, also known as robot-assisted surgery, enables surgeons to perform a wide range of complex procedures with greater precision, versatility, and power.

Scope of the Journal Journal of Endocrine & Gynecologic covers following field:

Gynecologic: A hysterectomy is a significant procedure in which the uterus of a woman is removed. It is used to treat a variety of issues linked to cycles, pelvic pain, tumours, and other disorders. A hysterectomy is a surgical procedure that involves the removal of the uterus (womb). **Reconstructive Surgery:** The aim of reconstructive surgery is to heal people and restore function. It is used to correct and reshape bodily structures that have been damaged by birth defects, developmental abnormalities, trauma/injuries, infections, tumours, or disease. It's also a specialty where the complexity and breadth of surgical knowledge has greatly increased in the last three decades. **Robotic Surgery:** Robotic surgery is a technique that involves using very small tools attached to a robotic arm to perform surgery. The surgeon uses a device to monitor the robotic arm. The surgeon controls the movements of a robot from a computer station. The robot's arms are equipped with small surgical instruments. Computer-assisted
