

**Fever is not Symptom of any disease and Non of diseases require fever as its symptom**

**K.M.Yacob**

Marma Health center,Kochi,kerala

**Abstract:**

We've been hearing for centuries that 'fever is not a disease, but a symptom.' Physicians say that fever is a symptom of diseases such as flu and cancer. The definition, diagnosis and treatment of conservative fever is based on fever as a symptom. All studies related to fever as a symptom of a disease have been conducted without knowing the purpose of fever temperature. Without knowing the purpose of fever temperature, how can fever be included in the definition of symptoms? Can temperatures between 38o and 41o centigrade be a symptom of a disease? Different causes of illness never show the same symptoms. Different causes of diseases like viruses, bacteria, fungi, poison, horror scene, horror dreams, rarely present the same symptoms.

**Biography:**

K M Yacob is a practicing Physician in the field of Healthcare in the state of Kerala in India for the last 30 years and is very much interested in basic research
