

Is it Sufficient for the Present Emerging 2014 Africa Ebola Virus Infection Outbreak?

Viroj Wiwanitkit*

Hainan Medical University, Hainan, China

Ebola virus infection is a present considerable problem that killed many people in Africa in 2014. The problem is still uncontrollable and becomes the important issue in global public health. With rapid increasing number of infected cases, the problem is still hard to be managed. Also, the knowledge on the Ebola virus infection is lacked. Of interest, the present 2014 African Ebola virus infection outbreak is a new epidemic that occurs in Africa. The knowledge on the problem is very limited. Few scientific reports have been published on the clinical problem since its first appearance. The case series reported by Baize et al. [1] is good information. However, the report is limited in information. The infection presents with acute febrile illness with hemorrhagic disorder. The fatal outcome can be seen and there is still no drug or vaccine to counteract. Of interest, there are extremely few case report

from the present situation. As noted by Wiwanitkit [2], the case report is the most important tool and source of knowledge for cases of any new emerging diseases. The medical practitioners and scientists are hereby encourage to report and publish their experiences on the infected cases for helping our global medical society to know, learn and use for further fighting with the present of Ebola.
