

Market Analysis 2020: The Strategies to Cure and Prevention of the Anonymous Diseases

Dr. Bachan Sharma

Professor of Biochemistry & Ex-Chairman, Department of Biochemistry Ex-Coordinator, Centre for Biotechnology Nodal Officer: Intellectual Property Rights Cell, The University of Allahabad, India, E-mail: sharmabi@yahoo.com

We invite all the participants throughout the world to join us for the upcoming “[European Summit on HIV, STD and STIs](#)” to be held on August 19-20, 2020 in Milan, Italy working with the theme: “**Creating New Strategies to Prevent HIV/AIDs, STDs and STIs**”.

HIV-AIDs Market Research Report:

Antiretroviral therapy (ART) is recommended to treat HIV infection. People on ART take a combination of HIV medications every day. HIV medicines can also decrease the risk of HIV transmission. [HIV Diagnostics](#) market size was valued at USD 2.9 billion in 2017 and is expected to witness 8.7% CAGR from 2018 to 2024. Increasing prevalence of HIV infection worldwide will majorly boost HIV diagnostics market growth over the forecast period.

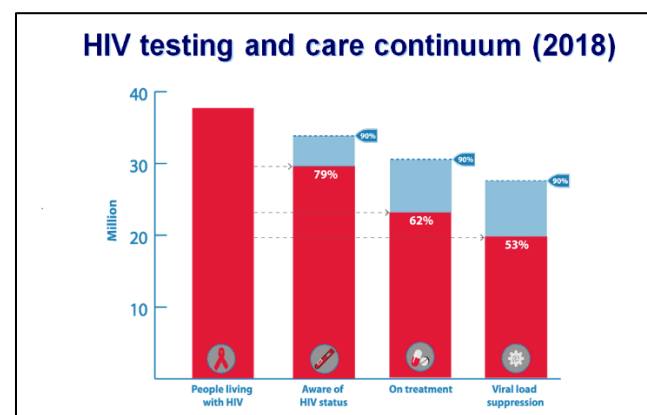

HIV infection is one of the leading causes of morbidity and mortality. As per the UNAIDS's data more than 36.7 million people across the globe were living with HIV in 2017.

Around 1.8 million children aged below 15 years had HIV infection. Additionally, many were infected by their HIV-positive mothers during pregnancy, childbirth or breast-feeding. Growing incidences of AIDS especially in the developing and underdeveloped economies will offer several growth opportunities in HIV diagnostics resulting in industry growth.

HIV Drug Market Analysis:

Human immunodeficiency virus (HIV) is one of the most infectious diseases with around 36.7 million people suffering by the end of 2015, according to The Joint United Nations Program on HIV/AIDS (UNAIDS). Global HIV Drug Market was valued at **\$20,448 million** in 2015 and is expected to garner **\$26,458 million** by 2022. In 2017 the global HIV drugs market exceeded a value of US\$ 17 Billion.

Looking forward, the market value is expected to reach nearly US\$ 21 Billion by 2023, expanding at a CAGR of more than 3% during 2018-2023.

HIV Infected Death Rate:

HIV infected death rate 7, 80, 000 people died of HIV-related illnesses worldwide in 2018. Expanded access to antiretroviral therapy (ART) and a declining incidence of HIV infections have led to a steep fall globally in the number of adults and children dying from HIV-related causes.

The estimated 770 000 people dying from HIV globally in 2018 were 56% fewer than in 2004 (the peak) and 33% fewer than in 2010 despite a period of substantial population growth in many high burden countries. Nevertheless, there is no room for complacency.

Countries need to live up to their commitment to end the [AIDS epidemic](#) as a public health threat by 2030 - a target included in the 2030 Agenda for Sustainable Development adopted by the United Nations General Assembly in September 2015. The immediate challenge is to reach the Fast-Track targets for 2020, as HIV-related deaths are still unacceptably high.

Global Data:

Since the beginning of the HIV epidemic, more than 70 million individuals were infected approximately with the HIV and about 35 million people died of HIV. Universally, 36.9 million people are living with HIV at the end of 2017. An expected 0.8% of adults aged 15–49 years affected with HIV, although the burden of the epidemic continues to vary considerably between countries and regions. The WHO African region remains most severely affected, with nearly 1 in every 25 adults (4.1%) living with HIV and accounting for nearly two-thirds of the people living with [HIV worldwide](#).
