Since the Big Bang was recognized as the source of the existence of the universe, many physics conclusions have been made. If it were scientifically recognized that our universe was created in the collapse of a star in another universe with millions of years' time distortion, then other physics conclusions would have been made. All phenomena not understood in the solar system attributed to nuclear fusion. For example rotate the sun around the axis and rotate the equator faster than the poles.

The sun's corona is 300 times warmer than the surface of the sun. Magnetism within the sun. The tilt of the planets with polarity changes at half the circumference of the sun. The energy source of the sun. The very existence of the sun. But there is phenomenon that can explain all the phenomena attributed to nuclear fusion within the sun and it is a collapse of a star in another universe distorted in time and the formation of a new sun. Because of the distortion of time between universes the mass coming out of the black hole is star dust saturated with the energy of natural gas and fuel. When the dust of the stars ignites, a new sun is created. A black hole injects star dust into the sun and turns the sun around the axis, causing the equator to circulate faster than the poles. Natural gas and fuel float, burning outside the sun and causing the corona to be 300 times warmer than the surface of the sun. Increased magnetism in the sun is actually the gravity of the star collapses in another universe that passes through a narrow opening of the black hole, in two opposite directions.

The tilt of the planets is also due to the increased gravity of the sun as a result of the gravity of the star collapsing in another universe that passes through a narrow opening of the black hole, in two opposite directions. The energy of the sun is produced by the combustion of gas and fuel on the surface of the sun. The sun was created from star dust which came from the collapse of a star in another universe through a black hole with time distortion between the universes. The sun was created in the same process as the earth, at the deep of the earth there is gas and fuel, which point to the need to find a source of gas and

fuel within the sun that will be the source of the sun's energy. The sun's corona is 300 times warmer than the surface of the sun. Gas and fuel can float to the surface of the sun and burn out on the surface of the sun and thereby can cause the phenomenon of the sun's corona to be 300 times warmer than the surface of the sun. Around the solar system there is burnt star dust that indicates the high probability that there is still a source in the sun that injects star dust into the sun. The equator of the sun rotates faster than the poles which attest to the external force of black hole in the sun which can injects mass of star dust into the sun.

The increased magnetism in the sun indicates that there is gravitational force of a star collapsing in another universe which affects the gravitational force of the sun along the axis of the sun. The tilt of Earth's proves that there is a star collapsing in another universe whose gravity passing through a narrow opening of the black hole causes the earth's tilt. The passage of mass through a black hole with time distortion explains the flow of star dust into the sun for millions of years, explaining the chemical process in which mass of star collapses change into star dust. The gravity of the star collapsing in another universe explains the illusion of magnetism of the sun. Fiery looping rain on the sun is an arc shaped, which shows that there is flow of mass in two directions through a black hole that has two opposite exits.

By that indication, the fiery looping rain on the sun is a white hole in the sun, rotating the sun, injecting star dust into the sun and being the source of energy for the sun. All traces of nuclear fusion within the sun can easily be attributed to the energies produced by new materials found in star dust. Natural gas and fuel have the ability to cause fusion in the sun by combustion of natural gas and fuel outside the sun and because nuclear fusion cannot cause the sun's corona to be 300 times warmer than the surface of the sun, than the conclusion is that gas and fuel are the only energy source of the sun and there is no nuclear fusion within the sun. It shows that the component of natural gas and fuel is a major component of solar activity.
