

Note on Cosmetic Dermatology

Aylin Turel Ermertcan*

Professor, Division of Dermatology, Celal Bayar University, Turkey

Editorial

Cosmetology is the research and execution of skills to beautify the eyes, face and hair and Dermatology is the medical division that deals with the skin. For both medical and surgical elements, it is a speciality. It is a combination in both medical and surgical elements. Dermatology treatments strengthen the skin's natural appearance by addressing different disorders, such as hyperpigmentation, acne, scars, and wrinkles. Liposuction is exclusively for doctors. Cosmetic dermatology helps to evaluate and cure cosmetic skin disorders with treatments such as Botox, injections of collagen, chemical peels, dermabrasion, laser treatment and liposuction.

Botox

Botox Topical is a wrinkle muscle relaxer with an injectable. To briefly paralyse the muscle, it uses type A botulinum toxin, specifically OnabotulinumtoxinA. The presence of facial wrinkle is minimised by this. A Therapy with Botox is minimally invasive. For fine lines and wrinkles around the eyes, it is considered a healthy, reliable procedure. It can also be used between the eyes on the forehead.

Chemical peels

Chemical peels are aesthetic treatments that may be applied to the face, hands, and neck. They're used to enhance the look or feel of the face.

Chemical solutions will be added to the region being treated during this process, which allows the skin to exfoliate and gradually peel off. The new skin beneath is also cleaner, looks less wrinkled and can have less damage once this occurs.

Dermabrasion

Dermabrasion is an exfoliating procedure that eliminates the outer layers of skin, usually on the face, using a spinning tool. This procedure is common with individuals who want to enhance their skin look.

Laser Treatment

Laser therapy uses guided laser rays to heal parts of the body that are impaired. Tumors and other growths may be removed, vision restored, hair loss prevented, and pain treated. The visibility of scars can also be enhanced by laser treatment.

Liposuction

Liposuction is a medical method that extracts fat from various parts of the body, such as the chest, hips, legs, buttocks, arms or neck, using a suction technique. Liposuction also forms certain regions (contours).
