

Torsion Of A Splenule In A Case Of Splenogonadal Fusion Mimicking Strangulated Inguinal Hernia

Dr. Sujata Sai

Manipal Hospital, Bangalore, India

Abstract: Testicular torsion refers to the torsion of the spermatic cord structures and subsequent loss of the blood supply to the ipsilateral testicle. This is a urological emergency; early diagnosis and treatment are vital to saving the testicle and preserving future fertility. Treatment: Immediate surgical exploration is indicated for patients with testicular torsion. For reliable salvage of the testicle, surgical repair must occur within six hours of symptom onset. If treatment is delayed, the patient may experience decreased fertility or may require orchiectomy. Some major research work is going about this in India.

Biography: Sujata Sai is a resident in surgery at Manipal Hospital, Bangalore. She is passionate about saving and changing lives. She also enjoys blogging about her experiences as a surgical resident. She has consistently done excellently academically, and has excelled in multiple extra curricular activities as well – She has given the Trinity College of Music Piano exams, is a part of several volunteer organisations for social service and participates in several sports as well.
