

Consequences of Riverbank Erosion among Rural Household along the River of Meghna in Bangladesh

M. Shohel Ranaa*, Nilufa Aktara, Kabir Hossaina, Asmaul Hosnaa and Ryan Amita

Department of Statistics, Noakhali Science and Technology University, Noakhali, Bangladesh

Abstract

Bangladesh, a riverine country, is suffering from acute riverbank erosion which compels millions of her population to be displaced from their place of origin. Flood and riverbank erosion are dynamic and natural processes which have an adverse impact on livelihood. Our study focuses the socio-demographic profile of the victims of the study area. In our study we have a large number of the respondents receive the formal education that is also 60% of the respondents. Only 10% of respondents who finished the S.S.C. The damage caused by this disaster is a negative cause of illiteracy in the region. About 56% respondent says that river erosion has an impact on their child education. Most often after losing their home they have moved somewhere else therefore their child can't attend the same school. More than 2 times the people about 54.9% are facing riverbank erosion and 98.8% of them are migrated to another place. After migration 66.4% of them are facing economic crisis and 82.6% of them have changed their occupations due to this calamity. Accommodations, education, treatment, are one of the basic needs which are in great trouble for those areas. Even after so much, only 70% of the people didn't get any relief. Above all, 88% people believe that such kind of disasters can be solved by constructing embankments. There is a significant association between educational level and tackling erosion. In fact, caused riverbank erosion every year unemployment, landless and poverty are increasing which is responsible to country wide unstable condition.

Keywords: Riverbank • Consequences • Erosion • Household • Migration

Introduction

Riverbank erosion is considered one of the major natural disasters in Bangladesh, one of the adverse consequences of climate change. Riverbank erosion is a natural slow-onset hazard that upsets the balance of many fluvial and coastal environments of the world by wearing away the bank materials from a river's banks. This geomorphic process results in the shorelines' movement from its original position, affecting the lives of the people living nearby Islam and Rashid [1,2]. Bangladesh is a riverine country which is criss-crossed by more than 220 rivers, 57 of them are international, with a stretch of 2,400 kilometers (km) of bank-line [3]. All these rivers are divided into three major river systems *i.e.*, the Ganges-Padma, the Brahmaputra-Jamuna and the Meghna. The catchment area of these major rivers is about 1.65 million km² of which only 7.5 percent lies within the border of Bangladesh that generates 1,200 km³ of run-off annually, only 10 percent of which is generated within Bangladesh [4]. Bangladesh is susceptible to numerous natural disasters such as tropical cyclones, storm surges, coastal erosion, floods, droughts and riverbank erosion causes heavy loss of life and property. Furthermore, every year, natural calamities affect people's lives and

livelihoods in some parts of this country. Due to climatic and non-climatic variability and change, life and livelihood of the general people of Bangladesh are heavily dependent on the local ecosystem; but their services are under immense pressure all over the country [5]. The Bangladesh is situated in the Bengal delta which was developed by three mighty rivers *i.e.*, the Ganges, the Brahmaputra and the Meghna (GBM) [6]. The sediments deposited in the GBM basin is the highest in amount in the world [7]. factors that affect riverbank erosion are; decrease or increase in shear strength, changes of river course, characteristics of erosion prone bank and bed materials, pressure imbalance at the bank face, rapid drawdown, poor vegetation cover, obstacle in the streams, wind wave and boat wakes [8]. As such, 283 locations, 85 towns and growth centers, along with 2400 kilometers of riverbank line in Bangladesh are vulnerable to erosion. The union of this upazila is Char Falcon has 30,815 people who are suffering most due to river erosion. 'Internally Displaced Populations' (IDP) face many unavoidable problems at different stages of displacement. Displacement marginalized them in respect of livelihood patterns and psycho-physical troubles [9]. Erosion and accretion processes vary in a decade scale along the main rivers of Bangladesh, which can also be influenced by anthropogenic activities [10]. Storm surges, tidal ranges and wave action are the main

reasons for erosion at the front of the Bay of Bengal in coastal Bangladesh. Erosion has significantly reduced many islands in Bangladesh over the past 100 years. Riverbank erosion continues to create hardship and stress on the lives of people living in riverbank areas in Bangladesh [11,12]. Bangladesh, a riverine country, is suffering from acute riverbank erosion which compels millions of her population to be displaced from their place of origin. The Kamalnagar upazila of Laxmipur districts is the victim area of riverbank erosion of Meghna river. We have conducted our survey by primary data collection on 8 January, 2021 including 23 survey questions on the basis of their livelihood. In this area people have lost their home, land, hospital, educational institutions by the aggression of Meghna river. As such, 283 locations, 85 towns and growth centers, along with 2400 kilometers of riverbank line in Bangladesh are vulnerable to erosion. The union of this upazila is Char Falcon has 30,815 people who are suffering most due to river erosion. 'Internally Displaced Populations' (IDP) face many unavoidable problems at different stages of displacement. Displacement marginalized them in respect of livelihood patterns and psycho-physical troubles. Riverbank erosion, a factor which accounts for the largest losses in Bangladesh, occur gradually but has long-term impacts and is not recoverable naturally. Riverbank Erosion is an important geo-morphological phenomenon affecting changes in river channel courses in alluvial plains creating long-term impacts and is not recoverable naturally. This erosion problem is a regular phenomenon in Bangladesh and about 15 to 20 million people are at risk from the effects of erosion in the country while about 1 million people living in 94 upazila are directly affected by riverbank erosion every year. Newly settled people along with the people who have recently lost their home are interviewed to find out the difficulties associated with rearrangements for them. Along with this problem of displacement, effects on their income, local crime rate, effects on their family relations, sufferings, government effects to prevent erosion are revealed in this paper. Moreover, there is no effective plan of action to resolve this problem in Bangladesh [13].

Objective

- To study the social life of people affected by riverbank erosion.
- To study the impact of riverbank erosion and its effect on the people include not only income and expenditure poverty but also damage to other aspects of human socioeconomic development like, health, education, living conditions, and security.
- To determine the migration and resettlement patterns of Bangladesh.

This study took place in Chor Falkan union of Ramgati Upazila, Lakshmipur, Bangladesh. The study area was selected through field observation because the coastal area of Bangladesh is at great risk for its geographical uniqueness to be affected by riverbank erosion. A number of villages in Ramgati upazila of the district have already been devoured by the Meghna river. The erosion-hit villages are Aslipara, Ramgati Bazar and Ramdayal under Ramgati upazila and Nasirganj, Hajiganj of Charkalkini union, Kadir Panditerhat of Saheberhat union, Ludhua Folkon of Char Folkon union and Dakshin Folkon of Patarihat union in Kamalnagar upazila. Lands are disappearing as erosion continues. Some 16,000 acres of crop lands, 15 educational institutions, cyclone shelter centers, four colonies of Ashrayan project, a stretch of 20 kilometer cross dam,

roads, mosques and various structures have been devoured by the Meghna river in the last 40 years (locals informed). In this research method, individual's information was collected through using a questionnaire where the respondents are asked questions and collected information. The data were collected through applying face-to-face interview techniques. Based on the Yamane sampling formula; where 95% confidence level and the margin of error (.05) were accepted. Altogether 81 samples were taken from 2691 households. And then adapting purposive sampling, the household heads were selected for interviews.

Statistical analysis

We perform descriptive analysis and graphical presentation, mean, standard deviation, Cramer's V value *chi-square* test and meta analysis were used on socio-demographic factors to find out the association between various nominal and categorical variables. The t-test was applied to test the significance of the study variables. Finally, Binary Logistic Regression used to find out the individual expectation on dependent variables. We use the SPSS-25 version, MS Excel and MS-Word for performing analysis.

Literature Review

Md. Shohel Rana and Ayesha Meherun Nessa discussed in their study the impact of riverbank erosion on population migration and resettlement of Bangladesh. From this study it was observed that every year thousands of hectares of land were washed away by the aggressive rivers e.g., the Jamuna, the Padma, the Meghna. As a result thousands of people landless, homeless and lose their resources every year. In the study area some landless people leave without shelter and food to their own safe destination. Therefore to get out of this problem, some changes are needed such as honest political leaders, initiatives of institutions and service organizations that will work tirelessly for the victims of riverbank erosion [14].

Tanjinul Hoque Mollah and Jannatul Ferdaush defined migration as a significant part of human history as the movement of people over some distance and from one usual place of residence to another due to search of food, shelter or civilizing living conditions. Migration occurs both temporary and permanently. Temporary migration is migration to an area that is not intended to be permanent, for a specified and limited period of time, and usually undertaken for a specific purpose due to climate stress. Permanent migration occurs when the people landless, homeless and lose their resources [15].

Due to riverbank erosion millions of people are affected and the result is loss of housing, crops, cattle and also farmland. Bangladesh Water Development Board (BWDB) said the districts which are most in risk are Bogra, Sirajgonj, Kurigram, Lalmonirhat, Rangpur and Gaibandha [16]. Abdus Sattar Paloan convener of the organization said "Almost 50% of the kamalnagar and Rangamati upazilas were washed away in twenty years. If emergency measures are not taken along with the dam construction, the very existence of Kamalganj upazila will be compromised [17]." BWDB Engineer of Laxmipur Md Arifur Hossain said: "We conducted a survey over a 15.5 kilometer area as part of the second phase. When we get the survey results, a design will be proposed to the authority, and the

construction will begin soon after [18].” Usually migration occurred from rural to urban area in search of livelihood but there is occurred internal migration to and fro because of riverbank erosion. Thousands acres fertile land, 35 schools, 15 markets outspent in Meghna river. Three major rivers (the Ganges, the Brahmaputra-Jamuna, the Meghna) are in Bangladesh 1.1 million acre feet are running in Bangladesh which occurred flooding, riverbank erosion, and house displacement. That’s why poverty, landlessness lag behind the rural people. The people who migrated to another area from the riverbank erosion area have suffered socially and economically in their current place.

respondents between the ages of 15-35. Which means that the respondent is mostly young. We have some older respondents too. Though the number of the older respondents is only around 15%. Education which is one of the basic necessities of life can also promote the overall development of a society. In our study we have a large number of the respondents receive the formal education that is also 60% of the respondents. But only 10% of respondents who finished the S.S.C. We also found that the families mostly have 4-6 members. But there are also some families which have more than 7 members (Table 1).

Results and Discussion

The demographic data of the respondents show that there is a difference between the age of the respondents. We have 44%

Variable	Category	Frequency	Percentage (%)
Age of the people	15-35	36	43.9

Table 2. Impact on subsistence due to the effect of riverbank erosion.

This table represents the frequency and the percentage of all questionnaire variables according to their classification.

Comment: Illustrates that about 54.9% people have faced the river erosion more than 2 times that's why 98.8% people loss their home and migrated to another place. 80.5% people haven't change their occupation but there occurs impact of income on 90.2% people and 84.1% people face economic crisis also 61% people face identity crisis.50% people feel insecure and 69% people don't get any relief.

87.8% people thinks that the cause of this river erosion is absence of embankment but 54.9% people have said government don't take any preventive steps to reduce erosion. To tackle this erosion 46.3%people have said they need honest political leaders and construct embankments (Table 3).

Descriptive statistics

	N	Minimum	Maximum	Mean	Std. deviation	Variance
Age of people	82	1	3	1.7195	0.72477	0.525
Number of family member	82	1	4	2.3293	0.60969	0.372
Times of face erosion	82	1	3	2.2927	0.85328	0.728
Migrate after river erosion	82	0	1	0.0122	0.11043	0.012

Table 3. Descriptive statistics.

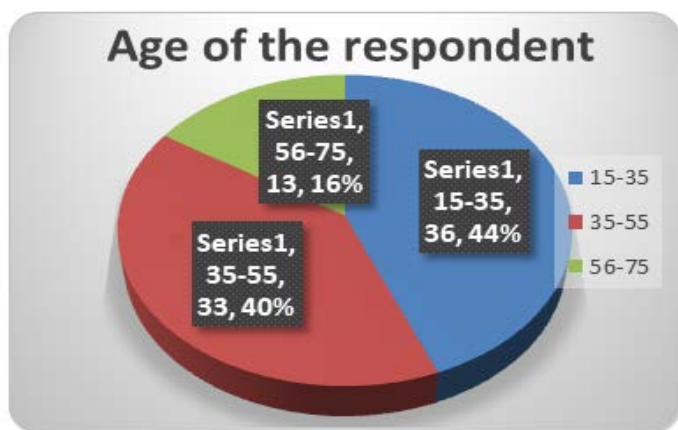

Figure 1. Age of the 44 respondents.

Above Figure 1 shows that, age of the 44% respondents between 15-35, 40% and 16% respondents are between (35-55) and (56-75) respectively. In total, we have 84% of respondents who are aged between 15 and 55. So, we can say that most of the respondents are young.

This Figure 2 shows 46% of respondents who belong to (4-6) members families. More family members are a hindrance to the livelihood of the afflicted people, so they have to go out on the path of earning without education.

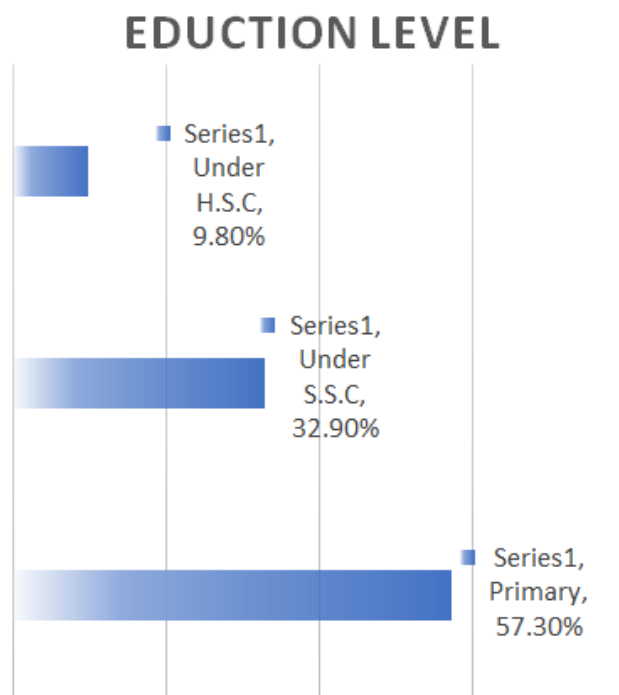

Figure 3. Education level.

Above Figure 3 shows, most of the respondents (57.30%) who at least go to primary school. The damage caused by this disaster is a negative cause of illiteracy in the region (Figure 4).

Number of Family Member

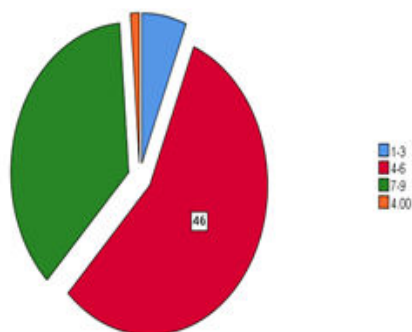

Figure 2. Number of family members.

Figure 4. Where people migrate.

From the above doughnut chart we saw that 61% of the respondent people who have lost their house due to river erosion migrated to the rural area (Figure 5).

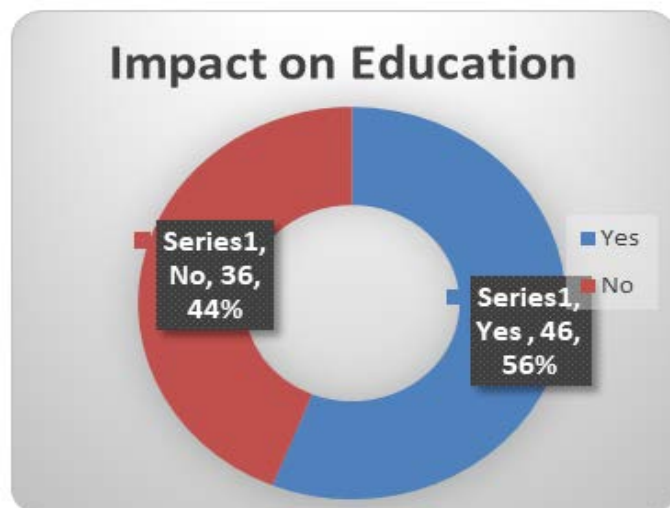

Figure 6. Impact on education.

From the Figure indicate that 56% respondent says that river erosion has an impact on their child education. Most often after losing their home they have moved somewhere else so that their child can't attend the same school (Figure 7).

Figure 5. Changing occupation.

From the graph we saw that 66 respondents out of 82 said that they have changed their occupation due to the river erosion (Figure 6).

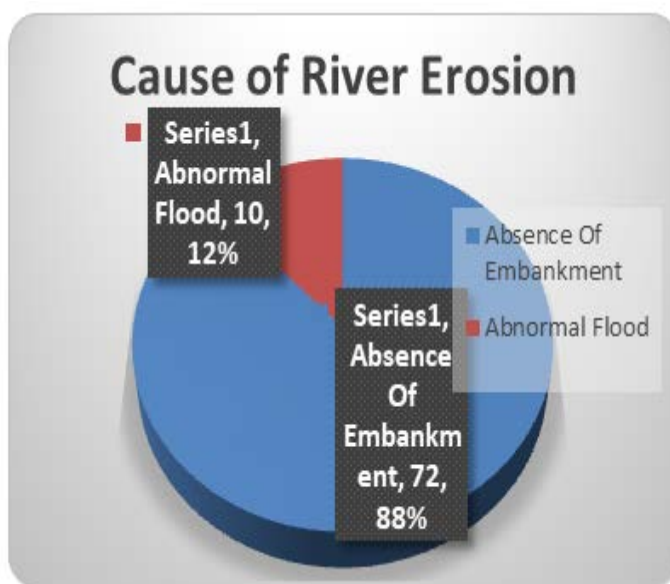

Figure 7. Cause of river erosion.

It has been found about 88% of the coastal people believe that, absence of the embankment is the main cause of the river erosion (Figure 8).

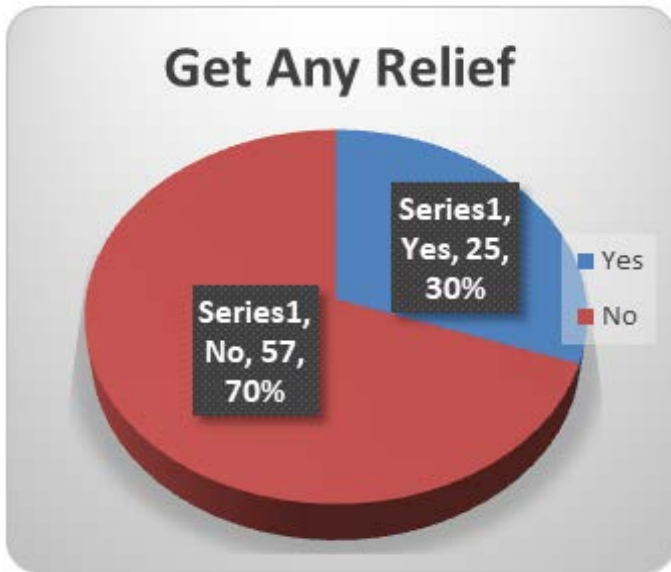

Figure 8. Get any relief.

It has been found about 70% of the affected people didn't get any relief (Figure 8).

Study area

The Kamalnogor upazila of Laxmipur districts is the victim area of riverbank erosion of Meghna river. The union of this upazila is Char Falcon has 30,815 people who have suffered most due to river

erosion (Figure 9). 'Internally Displaced Populations' (IDP) face many unavoidable problems at different stages of displacement. Displacement marginalized them in respect of livelihood patterns and psycho-physical troubles (Table 4).

Table 4. Logistic regression–cause of river erosion.

Variable (s) entered on step 1: Times of face erosion, losing home, migration after river erosion, where migration, changing occupation, impact on income, effect on education, face economic crisis, face identity crisis, feel insecure, govt take preventative steps to reduce erosion.

Above Table illustrates that 97% of the people are facing river erosion 2 times due to riverbank erosion which occurs for absence of

embankment and 73% people migrated to semi-urban area.82% people have changed their occupation and have harmful educational effects. 66% people face insecure after riverbank erosion which occurs for absence of embankment. 55% think that the govt. do not take preventive measure to reduce riverbank erosion which occurs for absence of embankment. Table 04 illustrates that 66.4% of the people who are affected by the riverbank erosion have faced economic crisis and 82.6% people have changed their occupation after migration (Table 5).

One sample t-test	N	Mean	Std. deviation	Std.error mean	Test value	95% Confidence interval of the difference upper lower	t	Mean difference	df	Sig. (2-tailed)

Chi-Square tests

	Value	df	Asymptotic significance (2-sided)
Pearson Chi-Square	12.144 ^a	3	0.007
Likelihood ratio	13.357	3	0.004
Linear-by-Linear association	2.772	1	0.096
N of valid case	82		

4 cells (50.0%) have expected count less than 5. The minimum expected count is .30

Table 13. Get any relief* number of family members.

Here, p value (.007) <level of significance (0.05), so number of family members and get any relief significantly related. We conclude

that there is significant association between family members and get any relief (Table 14).

		Education level	How to tackle erosion
Education level	Pearson correlation	1	0.051
	Sig. (2-tailed)		0.652
	N	82	82
How to tackle erosion	Pearson correlation	0.051	1
	Sig. (2-tailed)	0.652	
	N	82	82

Correlations

		Get any relief	Times of face erosion
Get any relief	Pearson correlation	1	0.260*
	Sig. (2-tailed)		0.018
	N	82	82
Times of face erosion	Pearson correlation	0.260*	1
	Sig. (2-tailed)	0.018	
	N	82	82

*Correlation is significant at the 0.05 level (2-tailed).

Correlations

		Where migrate	Changing occupation
Where migrate	Pearson correlation	1	0.321**
	Sig. (2-tailed)		0.003
	N	82	82
Changing occupation	Pearson correlation	0.321**	1
	Sig. (2-tailed)	0.003	
	N	82	82

**Correlation is significant at the 0.01 level (2-tailed).

Where $r=0.051$, which implies that educational level of respondents and tackle erosion weekly related to each other with positive slope. Highly educated people contribute more to tackling other natural disasters including riverbank erosion than less educated people.

Where $r=0.260$, which implies that time of erosion and get any relief weekly related to each other with positive slope. So we conclude that people get any relief increase gradually due to the number of times that erosion occurs.

Where $r=0.321$, which implies that place of migration and changing occupation weekly related to each other with positive slope. So we conclude that people with disabilities choose different professions due to relocation.

Meta-analysis

Let us consider,

H_0 : Facing river erosion is independent of migration after erosion and education level.

H_1 : Facing river erosion depends on migration after erosion and education level.

We conduct the test at 5% level of significance (Table 15).

Test statistic

$$\chi^2 = \sum \frac{O_{ij}^2}{E_{ij} - n}$$

Now the table of expected frequency is given below:

	Migrate after erosion			Total	Face erosion		
	yes		no		1 times	2 times	total
Education level	1 times	2 times	>2 times	Total	1 times	2 times	total
Primary	11.05	8.84	22.11	42	0.52	0.48	1
Under SSC	6.84	5.47	13.68	26	11.96	11.04	23
Under HSC	2.11	1.68	4.21	8	0.52	0.48	1
Total	20	16	40	76	13	12	25

Table 15. Migrate after erosion.

For migrate after erosion:

$$\chi^2 = \frac{12^2}{11.05} + \frac{9^2}{8.84} + \frac{21^2}{22.11} + \frac{7^2}{6.84} + \frac{4^2}{5.47} + \frac{15^2}{13.68} + \frac{1^2}{2.11} + \frac{3^2}{1.68} + \frac{4^2}{4.21} - 76$$

$$= 78.308 - 76 = 2.308$$

(P value, $P_1 = 0.679313$) The result is not significant at $P < 0.05$

As $P_1=0.679313>0.05$ so H_0 is accepted.

For not migrate after erosion:

$$x_2^2=1^2/0.52+0^2/0.48+11^2/11.96+12^2/11.04+1^2/0.52+0^2/0.48-25$$

$$=2.006 \text{ (P value, } P_2=0.366777)$$

The result is not significance at $P<0.05$

AS $P_2=0.366777>0.05$ so accept H_0 .

For conclusion using data of all migrate or not migrate meta analysis can be performed by combining the P values of x^2 where combined P value is given by

$$-2\ln P=-2\ln (P_1+P_2)$$

$$=-2\ln (0.679313+0.366777)$$

$$=-2\ln (0.2491563842)$$

$$=2.779349061$$

Thus $-2\ln P$ is distributed as x^2 with $2K=(2^2)$ ($K=2$) df. The tabulated value of x^2 at 5% level of significance with 4 df is 9.49 which is greater than x^2 ($-2\ln P$). So that, H_0 is accepted.

The calculation can also be done by combining the values of calculated for migrate and not migrate where combined x^2 is

$$x^2=x_1^2+x_2^2$$

$$=2.308+ 2.006$$

$$=4.314$$

This x^2 has $(4+2)=6$ df. The tabulated value at 5% level of significance is 12.59 which are greater than combined x^2 . So that, H_0 is accepted.

So this indicates that facing erosion is independent of migration after erosion and education level.

Conclusion

Our study focuses the socio-demographic profile of the victims of the study area. In our study we have a large number of the respondents receive the formal education that is also 60% of the respondents. Riverbank Erosion is an important geo-morphological phenomenon affecting changes in river channel courses in alluvial plains creating long-term impacts and is not recoverable Naturally.
