<b>Theme: Regeneration and proliferation ability of nerve cells</b>							
<b>Author and year</b>	<b>Name of paper</b>	<b>Study design</b>	<b>Aim of paper</b>	<b>Methods</b>	<b>Key findings</b>	<b>Contribution in current study</b>	<b>Critical analysis (+/-)</b>
Tomashevski, et al. 2010	Cyclin C-dependent cell cycle entry is required for activation of nonhomologous end joining DNA repair in postmitotic neurons	Retrospective neuronal morphology study	Understand the mechanisms underlying DNA repair in terminally differentiated neurones. Alongside the stimulatory factors triggering cell-cycle re-entry of these postmitotic neurones to undergo DNA damage response.	Cortical neurone cell cultures were obtained from E18 Sprague-Dawley rats, cells were seeded onto dishes. Cortical neurones were treated with hydrogen peroxide (H <sub>2</sub> O <sub>2</sub> ) to induce DNA damage.	H <sub>2</sub> O <sub>2</sub> induces repairable double-strand DNA breaks in terminally differentiated neurones. Neurones transitioning from G <sub>0</sub> to G <sub>1</sub> exposes them to double-strand DNA	The ability of postmitotic neurones to repair damaged DNA by re-entering the cell-cycle without producing two daughter cells indicates adaptations to avoid oncogenic mutations in developing in neurones.	Strengths: Saw consistent results with DNA repair using NHEJ. Positive and negative controls were used in immunoblotting analysis. Specific neuronal markers were used to identify

				Cells were fixed stained with DNA-binding dye to calculate number of apoptotic nuclei. Neuronal markers were used to see sites of non-homologous end joining (NHEJ) pathway activation in neurones. This was seen using immunofluorescence analysis. Immunoblotting measures expression of Cyclins following exposure of neurones to H <sub>2</sub> O <sub>2</sub> and transfected with either cyclin or control siRNA in order to detect cell-cycle progression.	breaks where proteins involved in regulating cell cycle are activated too early.	Repairing DNA damage using NHEJ	areas of DNA repair taking place <i>via</i> NHEJ. Limitations : Using rat models may not be translatable results into human studies. Non-randomised retrospective study increases risk of bias. Study was only focused on postmitotic neurones and could have benefited from

							Retrospective non-randomised study
Crocetti, et al. 2012	Epidemiology of glial and non-glial brain tumours in Europe	Prospective cohort study	Collectively analyse data to determine incidence, prevalence, and survival rate of a group of rare CNSTs.	<ul style="list-style-type: none"> <li>Establishment of categories of tumours depending on clinical management and patient referral structure.</li> <li>Glial tumours were categorised depending on WHO classification.</li> <li>Data was extracted from 44,947 rare types of CNSTs diagnosed between 1995- 2002 from different countries in Europe.</li> </ul>	<ul style="list-style-type: none"> <li>27,700 new “rare” CNS cases are estimated to be diagnosed every year in EU27.</li> <li>Rare CNSTs were marginally more frequent in men than women.</li> <li>Astrocytomas were the most common CNST at a rate of 4.8 per 100,000 and their location was most prevalent in UK and Ireland.</li> </ul>	from this study to compare three types of nerve cell tumours (astrocytomas, oligodendrogliomas and ependymal tumours) to compare the prevalence of these tumours in gender as well as age. This supported the statements that the tumours appear more commonly in the elder population in certain CNSTs.	<p>Strengths: This paper combined data from numerous different registries across Europe to provide representative data on incidence and prevalence rates of CNSTs. They achieved their aim and separated the types of CNSTs into sub-categories depending on their malignancies.</p> <p>Limitations : Only European not worldwide. Not all CNSTs, only a selected few of glial tumours to compare</p>

							against non-glioma CNSTs. Greater numbers of astrocytic tumours (86.9%) were examined in comparison to choroid plexus carcinomas (0.1%).
Hu, et al. 2020	Meningeal lymphatic vessels regulate brain tumor drainage and immunity	Retropective cohort study	Exploring the role of meningeal lymphatic vessels (MLVs) in drainage of brain tumours.	<ul style="list-style-type: none"> <li>• Retroviral vectors were created overexpressing GFP and VEGF-C in GL261 and B16 (glioma and melanoma markers) cells for detection.</li> <li>• Tumour cells were transplanted into mice, located 2 mm lateral to bregma and 3 mm deep to dura.</li> <li>• Deep and superficial lymph nodes were removed following ligation of collecting</li> </ul>	<ul style="list-style-type: none"> <li>• Dorsal MLVs undergo vast remodelling following glioma infiltration and are essential for dendritic cell trafficking towards deep cervical lymph nodes</li> <li>• Basal MLVs are susceptible to damage with increasing age</li> <li>• Dendritic cells showed reduced trafficking</li> </ul>	Understanding the contribution of the lymphatic vessels and lymph nodes in harbouring immune cells to destroy tumour cells in the CNS. In particular dendritic cell role in stimulating immune responses following activation in MLVs.	<p>Strengths: provide prospects for therapeutic opportunities targeting MLVs and cervical lymph nodes. Studying both basal and dorsal MLVs allowed differences to be seen rather than assuming the similar responses to tumour cell infiltration.</p> <p>Limitations: Mice models were used where</p>

				lymphatic vessels. • MRI and immunostaining were performed to detect tumour growth	ability from tumour tissue to deep cervical lymph nodes where dorsal MLVs were deformed.		conclusions in human model may be inconsistent with these results and the data may be incomparable.
Castriconi, et al. 2009	NK Cells Recognize and Kill Human Glioblastoma Cells with Stem Cell-Like Properties	Prospective cohort study	To explore the differentiation ability, tumorigenicity and expression of neural stem cell markers in stem-cultured GBM cells. In addition, exploring stem-cultured GBM cell susceptibility to lysis by autologous and allogenic NK cells.	• Tumour cells were separated from 9 patients with GBM. • These GBM cells were cultured <i>in vitro</i> in stem cell medium and were tested for neural stem cell markers and susceptibility to lysis by NK cells. • Flow cytometric	• Stem cell cultured GBM cells tested positive for neural stem cell markers but only 45% of cells showed differentiation properties compared to normal neural stem cells. • Stem cell cultured GBM showed tumorigenic potential where further injection of these cells developed gliomas in new mice. • Stem cell cultured GBM cells are	Understanding the ligand-receptor interactions between NK cells and GBM cells. This aided in understanding the role of the immune system in controlling tumour growths and destroying them using NK cells. Provided an understanding of the roles of various ligands on the surface of NK cells in responding to pathogens and tumours. In particular	Strengths: Only GBM patients with typical characteristics of GBM were included, this reduces the chance of anomalous data inclusion. Provides opportunities for therapeutic approaches to be created using activated NK cells against GBM. Limitation: Small sample size (9 patients, 7 males, 2 females), might be unrepresent

					<p>vulnerable to NK lytic abilities (both autologous and allogenic NK cells).</p> <ul style="list-style-type: none"> <li>• Key receptors were analysed for specific ligand interactions with stem cell cultured GBM cells</li> </ul>	<p>the role of NKp46 and DNAM-1 receptors in the efficient killing of GBM cells. This is important because DNAM-1 is frequently detected in most cancer cell lines including GBM and neuroblastomas.</p>	<p>ative of the population of GBM patients. Portions of this study were performed <i>in vitro</i> where results are less likely to be transferable to <i>in vivo</i> experiments. Only studies GBM rather than other types of CNS tumors such as astrocytomas. No financial contributions or conflicts of interest.</p>
Malmer, et al. 2001	Microsatellite Instability, PTEN and p53 Germline Mutations in Glioma Families	Retrospective cohort study	To investigate the presence of germline mutations in p53 and PTEN in related family members where two or more members suffer from	<ul style="list-style-type: none"> <li>• Paraffin-embedded tumour DNA and blood DNA samples were taken from 25 families (3 patient samples per family) who suffer from gliomas.</li> <li>• PTEN analysis was</li> </ul>	<ul style="list-style-type: none"> <li>• No MSI was found in association with any of the 35 tumours.</li> <li>• A repeated polymorphism was detected at exon 4 codon 7 in eight patients.</li> <li>•</li> </ul>	Contributed to the fact that nerve cell tumours are so rare due to the fact that germline mutations which increased prevalence of nerve cell tumours have not	Strengths: Mentioned that their results were corresponding to similar literature. All groups were treated with the same treatment

			<p>glioma tumours. Exploring whether microsatellite instability (MSI) is associated with glioma sufferers.</p>	<p>achieved with PCR with primers to PTEN • p53 exons were screened in blood DNA for exon mutations (exons 2-9) <i>via</i> temporal temperature gradient electrophoresis.</p> <ul style="list-style-type: none"> <li>• MSI was tested with two markers: BAT 25 and BAT 26.</li> </ul>	<p>Mutations were not shown associated with PTEN in any of the cases.</p>	<p>been detected in any of these patients. Also indicates the varying presentation associated with nerve cell tumours in terms of types of genetic mutations. Showed the types of syndromes associated with gene mutations in <i>TP53</i>, <i>PTEN</i> and <i>NF1</i> genes.</p>	<p>to detect mutations in the genes mentioned. Limitations : Tumour samples were paraffin-embedded which doesn't represent fresh tissue which could have displayed different results. No controls were used to compare mutation levels in gliomas to.</p>
<p>Khazaei, et al. 2020</p>	<p>The association between incidence and mortality of brain cancer and human development index (HDI): an ecological study</p>	<p>Prospective case study</p>	<p>Investigate the relationship of brain tumours morbidity and mortality rates with the socioeconomic development of countries by measuring their human development index (HDI).</p>	<ul style="list-style-type: none"> <li>• Data for the morbidity and mortality rates for brain cancer were taken from the World Bank for Cancer.</li> <li>• Morbidity rates to relate age and gender were calculated using the incidence rates reported in four separate cancer</li> </ul>	<ul style="list-style-type: none"> <li>• The total number of cancer cases found for both sexes are 18,078,957 in which brain tumours represented 296,851 (1.64% of total types of cancer).</li> <li>• The continent with the highest incidence</li> </ul>	<p>Provided information for whether brain tumours have increased likelihood of developing depending on ethnicity, gender, age, availability to healthcare.</p>	<p>Advantages : Using four different cancer registries allowed the researchers to get the most accurate incidence rates of brain tumours in countries. Prospective study Limitations : Certain</p>

				registries of countries until 2018. <ul style="list-style-type: none"> <li>• Mortality rates were estimated using four separate registries.</li> <li>• HDI was calculated using an index depending on three criteria: education, life expectancy and good standards of living. This created a scale for measuring HDI for the countries used in this study.</li> </ul>	rate was seen in Asia and the lowest seen in Oceania.		lower income countries do not have the healthcare facilities to report the incidence rate of brain tumours. This means that not all of the data here is representative of “worldwide trends”. Averages were assumed in the methods section.
